### Playing with Numbers:

Ram and Sita are playing with numbers by giving puzzles to each other. Now it was Ram's turn, so he gave Sita a positive integer 'n' and two numbers 1 and 3. He asked her to find the possible ways by which the number n can be represented using 1 and 3. Write any efficient algorithm to find the possible ways.

#### Example 1:

**Input:** 6

**Output:** 6

**Explanation:** There are 6 ways to represent number with 1 and 3

```
1+1+1+1+1+1
3+3
1+1+1+3
1+1+3+1
1+3+1+1
3+1+1+1
```

**Question 1** | Correct Mark 10.00 out of 10.00  Flag question

### Playing with Chessboard:

Ram is given with an  $n \times n$  chessboard with each cell with a monetary value. Ram stands at the (0,0), that the position of the top left white rook. He is given a task to reach the bottom right black rook position ( $n-1, n-1$ ) constrained that he needs to reach the position by traveling the maximum monetary path under the condition that he can only travel one step right or one step down the board. Help ram to achieve it by providing an efficient DP algorithm.

#### Example:

##### Input

```
3
```

```
1 2 4
```

```
2 3 4
```

```
8 7 1
```

##### Output:

```
19
```

#### Explanation:

Totally there will be 6 paths among that the optimal is

Optimal path value:  $1+2+8+7+1=19$

#### Input Format

First Line contains the integer  $n$

The next  $n$  lines contain the  $n \times n$  chessboard values

#### Output Format

Print Maximum monetary value of the path

**Answer:** (penalty regime: 0 %)

```

1 #include <stdio.h>
2
3 v int max(int a, int b) {
4     return (a > b) ? a : b;

Example:

s1: ggtabe

s2: tgatasb

s1	a	g	g	t	a	b	
s2	g	x	t	x	a	y	b
